1. Use a rigid and precise machine and holder.
2. We suggest using air bolow or MQL (mist).
3. These milling conditions are for an end mill where the tool extension length is 4 times the diameter of the end mill. When length of the tool extention from the machine is long, reduce the speed and feed and milling depth.
4. The above condition shows an approximate standard for contouring operation (side milling) with a low machining load. If abnormal cutting sounds, vibration or chattering occur depending on the machining shape, cutting amount, rigidity of the machine or work holding condition, etc., please adjust the speed, feed and the depth of cut.
5. When the radius of curvature is less than 1.5 times the tool diameter, please reduce the speed to 50 － 80%, the feed rate to 50 － 80%, and the pick feed to 20 － 60% of the above shown cutting conditions.
6. If the cutting depth is small, it is possible to further increase the speed and feed.

1. 機械、ホルダは剛性のある精度の高いものをご使用下さい。
2. 切削油は被削材に適したもので、発煙性の少ないものを選定して下さい。
3. この切削条件表は、エンドミルの突出し量が、(外径×10倍以下)を基準としたものです。突出し量が大きな場合は、びびりが発生しやすくなりますので回転速度、送り速度、切込深さを調整下さい。
4. 上表は、等高線加工(側面加工)の負荷の少ない加工形状での目安です。加工形状、切込深さ、機械剛性、ワーク保持等の使用状況により、異常な切削音、振動、びびりが発生する場合、回転速度、送り速度、切込深さを調整下さい。
5. 等高線加工でコーナ部の曲率半径が外径の1.5倍以下の場合は、上表の回転速度50～80%、送り速度50～80%、ピックフィード20～60%程度に下げてご使用下さい。
6. 突出し量が外径×10倍以下の場合や切込深さが小さい場合は、回転速度、送り速度をさらに上げることが可能です。

●エンドミルの選定の目安として、
・さらに仕上面の向上をご希望の場合、一般材においてはFX(WX)エンドミルシリーズ(FX-MG-EBD、FX-EBD-6、WX-EBD)をご使用下さい。また、高硬度材においては、FXSエンドミルシリーズ(FXS-EBDS)をご使用下さい。

1. Use a rigid and precise machine and holder.
2. Use a suitable cutting fluid with high smoke retardant properties.
3. These milling conditions are for an end mill where the tool extension length is 10 times the diameter of the end mill. When length of the tool extention from the machine is long, reduce the speed and feed and milling depth.
4. The above condition shows an approximate standard for contouring operation (side milling) with a low machining load. If abnormal cutting sounds, vibration or chattering occur depending on the machining shape, cutting amount, rigidity of the machine or work holding condition, etc., please adjust the speed, feed and the depth of cut.
5. When the radius of curvature is less than 1.5 times the tool diameter, please reduce the speed to 50 － 80%, the feed rate to 50 － 80%, and the pick feed to 20 － 60% of the above shown cutting conditions.
6. If the length of the tool extention is less than 10 times the diameter of the end mill and the cutting depth is small, it is possible to further increase the speed and feed.

● As a guideline in selecting end mills,
・If the better surface finish is required, please use the FX or WX End Mill series for general materials (i.e. FX-MG-EBD, FX-EBD-6, or WX-EBD), and the FXS end mill series for high hardened materials (FXS-EBDS).

注) FX-LS-ZDS、FX-ZDNをご使用の場合は、上表の回転速度、送り速度を70%～90%として下さい。
When using FX-LS-ZDS or FX-ZDN, please decrease the RPM and feed rate to 70 - 90% of the figures in the above table.

1 .上表は、ワーク上面が平坦でフライス前加工がしてあることを前提としたものです。
2 .上表は、穴深さが１D以下の場合のものです。
3 . 2Dを超す加工深さの場合は、ステップ加工を推奨します。
4 .機械、ホルダは剛性のある精度の高いものをご使用下さい。
5 .加工物の形状や保持方法の状況によって切削条件を調整して下さい。
6 .エンドミル取り付け時の刃先の振れは、10μm以下に抑えて下さい。
7 .切削油剤は被削材に適したもので、発煙性の少ないものをご使用下さい。
8 .工具径φ３未満を被削材【合金鋼・工具鋼】、【調質鋼・プリハードン鋼（快削材）】でご使用の場合は、水溶性切削油剤の使用環境を推奨します。
水溶性環境でのご使用の際は、上表の回転速度、送り速度を60%～80%として下さい。
9 .乾式の場合には、切りくず詰まりが無いよう、エアブローにて切りくずを除去して下さい。
10.工具径φ１未満は、斜面へのご使用は推奨しません。

1. This machining condition table applies to milling workpieces that have been flattened at the top through the removal of the forged surface (on a milling machine).
2. These machining conditions apply to hole depths of 1D or less. (D=outer diameter)
3. For hole depth of 2D or more, step milling is recommended.
4. Use a rigid and precise machine and holder.
5. Adjust the rotational speed and the feed rate in accordance with conditions such as the machining shape, machine rigidity, or work holding.
6. When chucking an end mill, keep the runout at the cutting edge below 10μm.
7. Please use a suitable fluid with high smoke retardant properties.
8. Water-soluble coolant is recommended when milling alloy steels, tool steels and hardened steels (free cutting steels) if the tool diameter is less than 3mm.
9. During Dry (no fluid) milling, please use air blow to remove cutting chips from the milling area and to eliminate chip packing.
10. Incline milling is not recommended if the tool diameter is less than 1 mm.
11. When machining an inclined plane, adjust the rotational speed and the feed rate in accordance with the angle of the incline (β).
When the machining incline angle (β) is less than 30°, please reduce the feed to 40～60%.
When the machining incline angle (β) is over 30°, please reduce the speed to 60～80% , the feed to 20～40%.
12. To avoid chip packing, step milling is recommended with pilot holes.
13. If it is necessary to ensure the locating precision of the hole to be machined, adjust the rotational speed and the feed rate as indicated above (in accordance with the machining precision requirement).
14. When machining magnesium alloy materials, please use the coolant oil recommended by the coolant oil manufacturer. Please also properly dispose the cutting chips to prevent fire hazards.

1. この切削条件表は、呼び径（大端径）を基準にしています。実切削径および切り込みにより切削条件を以下のように変更して下さい。
・回転速度は実切削径（大端側）に合わせて設定して下さい。
・送り速度は切り込みを考慮した実切削径（小端側）により設定して下さい。
2. 溝切削の場合は、側面切削の条件表を参考に切り込み量apを1/2以下（Max0.5mm）として、回転速度、送り速度ともに30～40%程度下げてご使用下さい。
3. 切削時に振動やびびり音が発生した場合は、回転数を下げてから送りを調整して下さい。
4. バリが発生する場合は、送り速度を下げて下さい。角面取り（側面切削）で送りを下げてもバリの発生が改善されない場合は、切込みを数回に分けて対応下さい。

1. This cutting condition is based upon tool diameter (larger size). Please change the cutting condition according to actual cutting diameter and depth of cut.
・Fix speed by actual cutting diameter (larger dia. side).
・Fix feed by actual cutting diameter (smaller dia. side) considering depth of cut.
2. When slotting, please reduce the above valves for speed and feed by 30～40 % and use 1/2 of amount of cut ap (maximum 0.5mm).
3. Please reduce the speed and adjust the feed if vibration and chattering occur while machining.
4. Please reduce the feed if burr occurs. If burr still occurs even reduce the feed while side milling, please reduce the depth of cut.

1. 高速高精度のマシニングセンタを利用した場合の、軽切込みの切削における基準条件表です。
2. 摩耗が進行すると火花が発生しますので、発火性のある切削油剤は絶対に使用しないで下さい。
3. エアブローをご使用下さい。切削油剤を使用される場合は、発煙性の少ないものを選定して下さい。
4. エンドミルの選定の目安として、比較的柔らかい被削材の場合では、通常のFXエンドミルを優先して使用して下さい。
硬い被削材では、FXスーパーエンドミル(FXS-EMS)を使用して下さい。

1. The indicated speeds and feeds are for high speed light milling with high speed / high precision machining centers.
2. Tools can cause sparks. Do not use flammable fluids.
3. We recommend using an air blow. When using cutting fluids, use a high-quality fluid with high smoke retardant properties.
4. In general, use FX End Mills for milling less hard materials. For harder materials, use FXS End Mills (FXS-EMS).

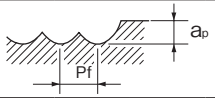
1. 機械、ホルダは剛性のある精度の高いものをご使用下さい。
2. エアブローまたはMQL(オイルミストクーラント)でご使用下さい。
3. 上表は、等高線加工（側面加工）の負荷の少ない加工形状での目安です。
加工形状、切込深さ、機械剛性、ワーク保持等の使用状況により、異常な切削音、振動、びびりが発生する場合、回転速度、送り速度、切込深さを調整下さい。
4. 等高線加工でコーナ部の曲率半径が外径の1.8倍以下の場合は、上表の回転速度50～80%、送り速度50～80%、ピックフィード20～60%程度に下げてご使用下さい。
5. 主軸端面からの突出し量が大きなホルダをご使用の場合は、回転速度、送り速度、切込深さを上表より下げ、調整を行って下さい。
6. 切込深さが小さい場合は、回転速度、送り速度をさらに上げることが可能です。



1. Use a rigid and precise machine and holder.
2. We suggest using air blow or MQL(mist).
3. The above condition shows an approximate standard for contouring operation (side milling) with a low machining load. If abnormal cutting sounds, vibration, or chattering occurs; depending on the machining shape, cutting amount, rigidity of the machine/ workholding condition, etc, please adjust the speed, feed, and depth of cut.
4. When the radius of curvature is less than 1.8 times the tool diameter, please reduce the speed to 50 — 80%, the feed rate to 50 — 80%, and the pick feed to 20 — 60% of the above shown cutting conditions.
5. When using a toolholder with an extended gage length; reduce the speed,feed,and depth of cut from the conditions listed above.
6. If the cutting depth is small, it is possible to further increase the speed and feed.

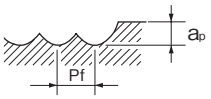
1. スピンドルスルーによるクーラント、エアーの供給装置を備えた高速高精度の機械での、高速軽切削加工の場合の基準条件表です。
2. 摩耗が進行すると火花が発生しますので、発火性のある切削油剤は絶対に使用しないで下さい。
3. エアブローをご使用下さい。切削油剤を使用される場合は、発煙性の少ないものを選定して下さい。
4. エンドミルの選定の目安として、比較的柔らかい被削材の場合では、通常のFXエンドミルを優先して使用して下さい。
硬い被削材では、FXスーパーエンドミル(FXS-EBDS)を使用して下さい。



1. These conditions are for light milling with precise, high speed / feed machines that supply air and coolant through the spindle.
2. Tools can cause sparks. Do not use flammable fluids.
3. We recommend using an air blow. If using cutting fluids, use a high quality fluid with smoke retardant properties.
4. In general, use FX End Mills for milling hard work materials. For extremely hard materials, use FXS End Mills (FXS-EBDS).

1. 高速高精度のマシニングセンタを利用した場合の、軽切込みの切削における基準条件表です。
2. 摩耗が進行すると火花が発生しますので、発火性のある切削油剤は絶対に使用しないで下さい。
3. この切削条件表は、首部勾配角 1° を基準に設定しております。首部勾配角 1° 30′、2° の場合には上記送り速度を20%～40%程度高く設定できます。切込みは加工精度に応じて調整下さい。
4. エンドミル取り付け時の刃先の振れは、10μm未満に抑えて下さい。
5. コーナ部等負荷が大きい加工には変動する場合においては、回転速度、送り速度ともに下げて使用下さい。
6. 機械の回転速度が上がらない場合は、できるだけ最高回転速度で使用し、送り速度を調整下さい。

1. The indicated speeds and feeds are for high speed light milling with high speed /high precision machining centers.
2. Tools can cause sparks. Do not use flammable fluids.
3. In this cutting condition table, the neck angle is set 1 ° as a standard.
   If the neck angle is set 1 ° 30′ or 2 ° , the above feed rate can be increased by approximately 20% to 40% higher.
   Adjust the depth of cut according to the required machining accuracy.
4. The run out of the end mill should be within 10μm after chucking.
5. During heavy load operations such as corner processing, reduce the speed and feed.
6. When using low speed machines, use the maximum speed and adjust the feed rate.

1. 高速高精度のマシニングセンタを利用した場合の、軽切込みの切削における基準条件表です。
2. 摩耗が進行すると火花が発生しますので、発火性のある切削油剤は絶対に使用しないで下さい。
3. エアブローをご使用下さい。切削油剤を使用される場合は、発煙性の少ないものを選定して下さい。
4. エンドミルの選定の目安として、比較的柔らかい被削材の場合では、通常のFXエンドミルを優先して使用して下さい。
   硬い被削材では、FXスーパーエンドミル(FXS-EMS)を使用して下さい。

1. The indicated speeds and feeds are for high speed light milling with high speed / high precision machining centers.
2. Because tools can cause sparks, do not use flammable fluids.
3. Use an air blow. When using cutting fluids, use a high-quality fluid with high smoke retardant properties.
4. In general, use FX End Mills for milling less hard materials. For harder materials, use FXS End Mills (FXS-EMS).

1. These conditions are for light milling with precise, high speed / feed machines that supply air and coolant through the spindle.
2. Because tools can cause sparks, do not use flammable fluids.
3. We recommend using an air blow. If using cutting fluids, use a high quality fluid with smoke retardant properties.
4. In general, use FX End Mills for milling less hard materials.

1. 溝深さに合わせ、首下長さは短いものより順次使用するほうが効果的です。
2. コーナ部の加工は、送り速度を約1/2に下げて下さい。
3. 切削油剤をご使用下さい。

1. To achieve flute depth, sequential one neck length at a time is most effective.
2. When corner processing, reduce the feed rate by approximately half.
3. Use cutting fluid.

1 .This machining condition table applies to milling workpieces that have been flattened at the top through the removal of the forged surface (on a milling machine).
2 .These machining conditions apply to hole depths of 1D or less. (D=outer diameter)
3 .Use a rigid and precise machine and holder.
4 .Adjust the rotational speed and the feed rate in accordance with conditions such as the machining shape, machine rigidity, or work holding.
5 .When chucking an end mill, keep the runout at the cutting edge below 10μm.
6 .Please use a suitable fluid with high smoke retardant properties.
7 .During Dry (no fluid) milling, please use air blow to remove cutting chips from the milling area and to eliminate chip packing.
8 .When machining an inclined plane,adjust the rotational speed and the feed rate in accordance with the angle of the incline (β).
When the machining incline angle(β) is less than 30°, please reduce the feed to 40～60%.
When the machining incline angle(β) is over 30°, please reduce the speed to 60～80%, the feed to 20～40%.
9 .If it is necessary to ensure the locating precision of the hole to be machined, adjust the rotational speed and the feed rate as indicated above (in accordance with the machining precision requirement).
10.When machining magnesium alloy materials, please use the coolant oil recommended by the coolant oil manufacturer. Please also properly dispose the cutting chips to prevent fire hazards.

Apply the correction coefficients indicated in the table above in accordance with the Length (LU) ／ Diameter (DC) of the end mill.
※ When setting the end mill with a long overhang, make sure to adjust both the speed and the feed rate.
※ When the effective length (LU) /diameter(DC) ＞7,High Speed Milling is not recommended. Please use Regular Milling conditions.

2. Please adjust the speed and feed when the cutting depth is large or when machines with low rigidity are used. The feed rate can be increased if the shape of the workpiece and method of fixation are rigid.
3. Reduce speed and feed as well as depth of cut when high precision is required.
4. When the chips wind around the end mill, reduce the speed and feed.
5. Please remove cutting chips to prevent them from getting caught or entangled.
6. For higher quality processing, the use of a water-soluble cutting fluid is recommended (excluding nylon and Bakelite).
7. Please step feed when processing by plunging.

11.脆性材の加工の場合は、粉塵対策を必ず行って下さい。舞い上がった粉塵は、引火、爆発の恐れがあります。吸引をすると人体に影響を及ぼす危険があります。
12.CFRP等の被削性は、レジンの性質やその含有量によって大きく影響を受けます。切削状況を見ながら回転速度、送り速度を調整下さい。

1 .This machining condition table applies to milling workpieces that have been flattened at the top through the removal of the forged surface (on a milling machine).
2 .These machining conditions apply to hole depths of 1D or less. (D=outer diameter)
3 .Use a rigid and precise machine and holder.
4 .Adjust the rotational speed and the feed rate in accordance with conditions such as the machining shape, machine rigidity, or work holding.
5 .When chucking an end mill, keep the runout at the cutting edge below 10μm.
6 .Please use a suitable fluid with high smoke retardant properties.
7 .During Dry (no fluid) milling, please use air blow to remove cutting chips from the milling area and to eliminate chip packing.
8 .When machining an inclined plane,adjust the rotational speed and the feed rate in accordance with the angle of the incline (β).
When the machining incline angle(β) is less than 30°, please reduce the feed to 40～60%.
When the machining incline angle(β) is over 30°, please reduce the speed to 60～80%, the feed to 20～40%.
9 .If it is necessary to ensure the locating precision of the hole to be machined, adjust the rotational speed and the feed rate as indicated above (in accordance with the machining precision requirement).
10.When machining magnesium alloy materials, please use the coolant oil recommended by the coolant oil manufacturer. Please also properly dispose the cutting chips to prevent fire hazards.
11.When machining brittle materials, please take proper measures to eliminate the dust. Airborne dust is flammable, may cause fire, and is a health hazard if inhaled.
12.The machinability of materials like CFRP is heavily dependent on the composition of the resin. Please adjust the RPM and feed rate accordingly based on cutting conditions.

1. 加工形状、機械剛性、ホルダ剛性、ワーク保持力等の使用状況により、回転速度、送り速度、切込深さを調節下さい。
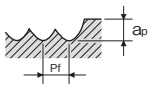
2. 回転速度、送り速度が上表より上がらない場合や回転速度、送り速度を同じ比率で下げてご使用下さい。
3. ワークの欠けが発生する場合や、精度の高い加工が必要な場合、必要に応じて送り速度を下げてご使用下さい。
4. 加工形状によって加工時にビビリが発生する場合は、回転速度と送り速度を同じ比率で下げて調節しご使用下さい。
5. グラファイト加工は専用加工機をご使用下さい。粉塵の吸入防止の為、グラファイトの周囲で作業を行う場合は集塵機、防塵マスクをご使用下さい。
6. 加工時はエンドミルの刃先の振れを0.01mm以下に抑えてご使用下さい。
7. 仕上げ加工の高能率加工を行う場合は、送り速度を3倍を上限に調節下さい。
8. 高能率加工を行う場合は、溝加工部など負荷がかかる部分の送り速度を30%まで落とす事により、工具のたわみによる削り残し量を軽減させることができます。
9. 平坦部の加工でむしれが発生する場合は、回転速度を上げてご使用下さい。
10. 形状隅部に当たる切削がある場合は、プログラムのコーナR処理を行うか、ビビリが発生しない回転速度に調節し、コーナ部減速（約60%）などを併用してご使用下さい。



1. Adjust the speed, the feed rate, and the depth of cut to suit your operating conditions, such as the milling shape, machine rigidity, tool holder rigidity, and work holding force.
2. If you are unable to raise the speed and feed rate higher than those indicated in the table above, lower the speed and feed rate using the same ratio.
3. If the workpiece gets chipped or if the operation requires a higher level of milling precision, lower the feed rate as necessary.
4. Depending on the shape, if the workpiece chatters, lower the speed and feed rate using the same ratio.
5. To mill graphite, use a dedicated milling machine. To prevent inhalation of dust, use a dust collector and a dust mask when working around graphite.
6. During milling, keep the runout at the tip of the end mill to be less than 0.01 mm.
7. To achieve efficient finishing, the feed rate may be adjusted as high as triple the rate.
8. For high-efficiency machining, lower the feed rate as far down as 30% for high-load operations such as slotting. This can minimize the amount of cutting remnants resulting from the flexing of the tool.
9. If gouging occurs while milling a flat area, raise the speed.
10. If a cut involves the shaping of a corner, use the corner radius process of the program, or adjust the speed so that it would not cause chattering, and reduce the speed at the corner at the same time (by approximately 60%).

傾斜切り込み角度は、0.3°～0.5°を目安に設定して下さい。　Set the diagonal plunge angle to be approximately 0.3° and 0.5°.

1. 加工形状、機械剛性、ホルダ剛性、ワーク保持力等の使用状況により、回転速度、送り速度、切込深さを調節下さい。
2. 回転速度、送り速度が上表より上がらない場合は回転速度、送り速度を同じ比率で下げてご使用下さい。
3. ワークの欠けが発生する場合や、精度の高い加工が必要な場合、必要に応じて送り速度を下げてご使用下さい。
4. 加工形状によって加工時にビビリが発生する場合は、回転速度と送り速度を同じ比率で下げて調節しご使用下さい。
5. グラファイト加工は専用加工機をご使用下さい。粉塵の吸入防止の為、グラファイトの周囲で作業を行う場合は集塵機、防塵マスクをご使用下さい。
6. 加工時はエンドミルの刃先の振れを0.01mm以下に抑えてご使用下さい。
7. φ4以上の荒取り加工で、コーナR以下のZ切り込み深さの場合、送り速度を3倍まで上げることが出来ます。
8. 仕上げ加工の高能率加工を行う場合は、2倍を上限に調節下さい。
9. 高能率加工を行う場合は、溝加工部など負荷がかかる部分の送り速度を30%まで落とす事により工具たわみによる削り残し量を軽減させることができます。
10. 水平部の平面を仕上げる場合は、送り速度を40%まで落とし、静粛性に優れた加工機でご使用下さい。
11. コーナR部で形状の仕上げ加工を行う場合は、加工ピッチ（コーナR×0.06＝仕上げピッチ）を変えてご使用下さい。
12. 形状隅部に当たる切削がある場合は、プログラムのコーナR処理を行うか、ビビリが発生しない回転速度に調節し、コーナ部減速（約60%）などを併用してご使用下さい。

1. Adjust the speed, the feed rate, and the depth of cut to suit your operating conditions, such as the milling shape, machine rigidity, tool holder rigidity, and work holding force.
2. If you are unable to raise the speed and feed rate higher than those indicated in the table above, lower the speed and feed rate using the same ratio.
3. If the workpiece gets chipped or if the operation requires a higher level of milling precision, lower the feed rate as necessary.
4. Depending on the shape, if the workpiece chatters, lower the speed and feed rate using the same ratio.
5. To mill graphite, use a dedicated milling machine. To prevent inhalation of dust, use a dust collector and a dust mask when working around graphite.
6. During milling, keep the runout at the tip of the end mill to be less than 0.01 mm.
7. When making a rough cut with a ø4 end mill or greater, you can raise the feed rate as high as triple the rate, for making a Z cut depth that is less than the corner radius.
8. To achieve efficient finishing, the feed rate may be adjusted as high as triple the rate.
9. For high-efficiency machining, lower the feed rate as far down as 30% for high-load operations such as slotting. This can minimize the amount of cutting remnants resulting from the flexing of the tool.
10. When finishing a horizontal plane, lower the feed rate as far down as 40% on a milling machine that operates quietly.
11. When finishing a shape with a corner radius, change the milling pitch (corner radius x 0.06 = finishing pitch).
12. If a cut involves the shaping of a corner, use the corner radius process of the program, or adjust the speed so that it would not cause chattering, and reduce the speed at the corner at the same time (by approximately 60%).

1. CFRPの被削性は、レジンの性質やその含有率、保持状態によって大きく影響され、上表を参考に、送りの調整をして下さい。
2. 上表は、およそ厚さの被削材を基準にしています。
3. 切削油剤は不要ですが、十分な粉塵対策（真空集塵）を施して下さい。
4. 仕上げ加工はアップカットで使用下さい。
5. 適切な切削油剤を使用しての加工においては、切削速度を20-50%上げることが可能です。
6. 加工物の肉厚、形状、保持状態により加工物がびびり振動を起こすことがあります。びびり振動が発生した場合は回転速度、送り量を調整下さい。

1. Machinability of CFRP will change by the character of resin and a percentage of content, also large influence by the way of part holding. Please refer above conditions to adjust feed rate.
2. The above conditions are based on approximately 1xDc thickness of part under rigid work holding.
3. Coolant is not necessary, however, please apply good dust control（Vacuum collection）.
4. Conventional cut is recommended for good surface finish.
5. Milling speed can be increased by 20-50% with the use of appropriate cutting oil.
6. Depending on the workpiece thickness and form as well as work holding, vibration may occur. When it occurs, please adjust RPM and feed rate.

If the pick amount is 0.5 x D or more, cusp may occur on the machined surface.
1. This tool is recommended for the roughing of additive manufacturing and mold overlay surfaces.
2. Please use machines and holders that are rigid and highly accurate.
3. The values listed above are for reference. Please set the cutting condition in accordance with the actual machining environment.
4. Please reduce the feed rate when the depth of cut is greater than specified.
5. The above table is a guide when the amount of protrusion of the tool is 4 x D or less. If the amount of protrusion is large, chattering is likely to occur, so adjust the rotation speed, feed rate and depth of cut with reference to the coefficients.
6. Please use a suitable fluid with high smoke retardant properties.
7. During dry (no fluid) milling, please use air blow to remove disposable chips from the milling area and to eliminate chip packing.
8. Please use water-soluble coolant when machining stainless steel, cobalt-chromium alloy, titanium alloy, and Ni-based alloy.
9. Tool runout should be kept to a minimum for maximum accuracy.
10. When the cutting load fluctuates in areas such as the corners, please reduce the rotational speed.

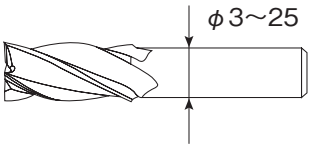
# Features of the HY-PRO Shrink Fit System　ハイプロシュリンクシステムの特長

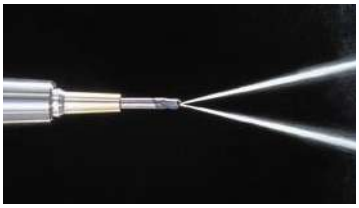
## 1 高い接近性 Accessibility

ホルダとシュリンクコレットからなる2ピース構造の為、ハイプロシュリンクはワークへの接近性に優れ、従来のコレット式ホルダでは干渉により加工が出来なかった壁際の加工が可能になります。



Because this device consists of two pieces, a holder and shrink collet, HY-PRO Shrink has superior access to work pieces and is capable of side wall operations, which cannot be performed by ordinary collet holders.

## 2 小径シャンクや h7 シャンクに対応 For Small Shank Diameter and h7 Shank



ハイプロシュリンクはφ3のシャンク径から使用できます。またφ6～25のシャンクではh7公差のものが使用でき、幅広い範囲の中から工具選定が行えます。

The HY-PRO Shrink can be used for drills with a minimum shank diameter of 3mm. If the shank diameter is between 6 and 25mm, the Shrink can use h7 tolerance. A wide variety of tools are applicable.

## 3 多様な給油方法 Various Coolant supply Devices

### 刃物スルー Through the Tool

油穴付き工具を使用して刃先から切削油剤を供給する場合に使用します。切削箇所に確実に切削油剤が届くため穴加工等では特に有効です。

Suitable when using a tool with internal coolant supply or a supply from the point of the cutting edge. This is especially effective for drilling because the coolant is guaranteed to reach the cutting area.

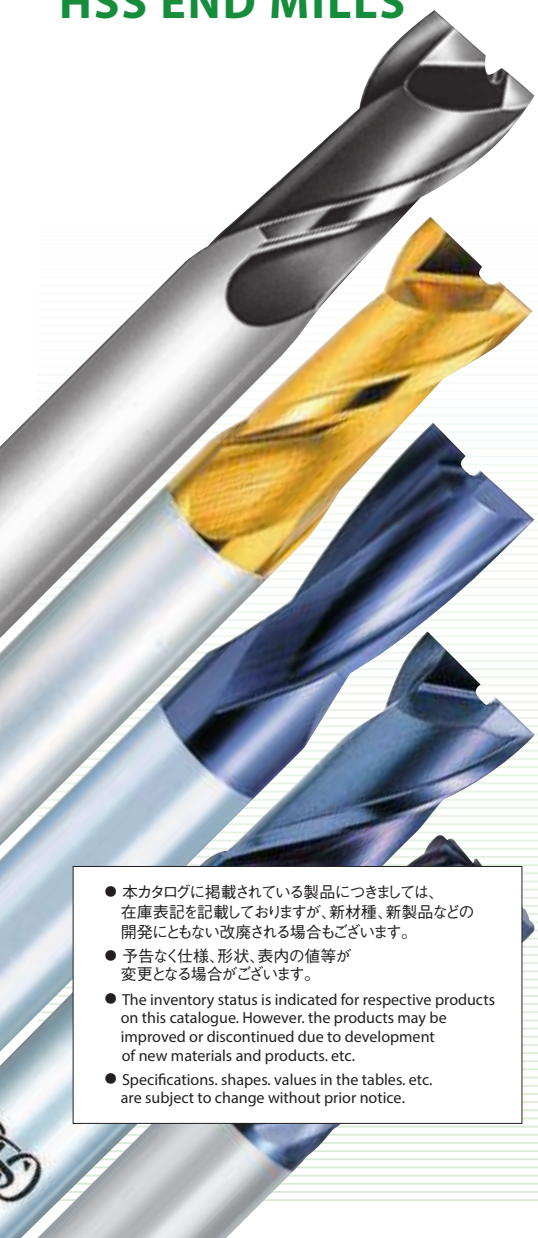
### ノズルスルー Through the Holder

ホルダ端面から切削油を供給します。油穴付きでない工具をレギュラ形またはスリム形のコレットに装着して使用する場合に用います。

Supplies coolant from the end face of the holder. This is used when attaching tools without internal coolant supply to a regular or slim type collet.

### フラッシュスルー Through the Collet

シュリンクコレット端面より切削油剤を供給します。コレットの端面径はレギュラ形、スリム形に比べ大きくなりますが、工具の近くからの給油が可能になります。



Supplies coolant from the end face of the shrink collet. Although the diameter of the collet end face increases, coolant supply becomes even more effective.

**全サイズ クーラントスルー対応　耐圧 7MPa** All sizes can be used with through coolants. Maximum Coolant Pressure:7MPa

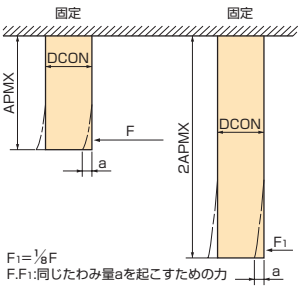
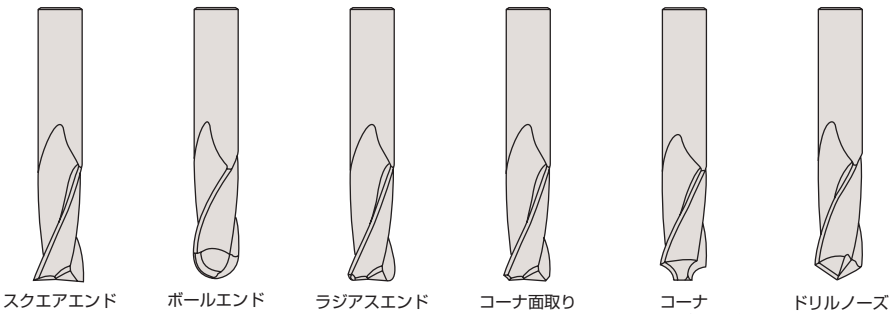
# ハイスエンドミルをお選びになる前に

## ■各部の名称



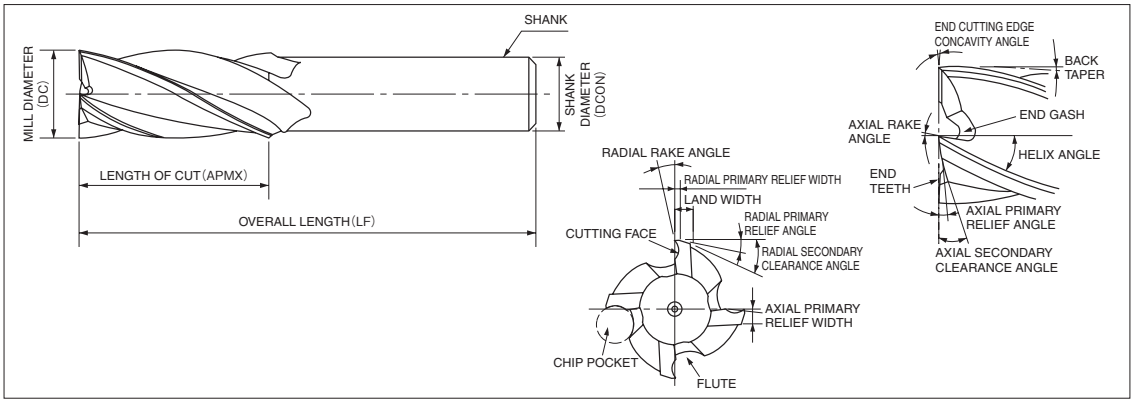
## ■刃数(ZEFP)

エンドミルの性能を左右する大きな要因のひとつに、刃数があります。一般に、刃数の少ないものはチップポケットが大きく、切りくずの排出はよいのですが、その反面、工具断面積は小さく、剛性は低下しますので、切削中にたわみを生じやすくなります。逆に、刃数が多くなると工具断面積は大きくなり剛性は大きくなりますが、チップポケットは小さくなり切りくず収容能力は低下し、切りくずづまりの状態を生じやすくなります。



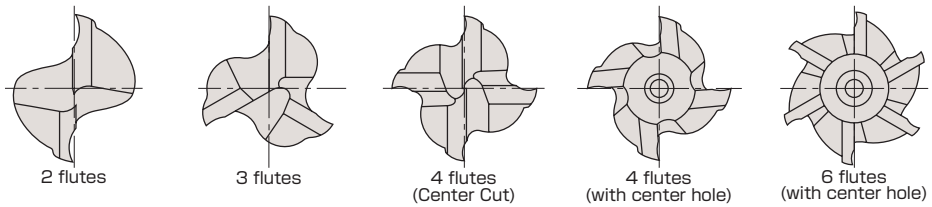
## ■刃長(APMX)

刃長は短いほど工具剛性が増し、切削性能もよくなります。エンドミルの剛性は刃長（突出し長さ）の3乗に反比例します。したがって、刃長（突出し長さ）が2倍になると工具剛性は1/8になります。エンドミルは横送りによって使用する工具ですから、このことは大変重要となります。必要以上に長い刃長のエンドミルを使用することは大きなデメリットとなります。OSGでは刃長のバリエーションも豊富に取り揃えておりますので、加工の内容に見合った最適な刃長をお選び下さい。

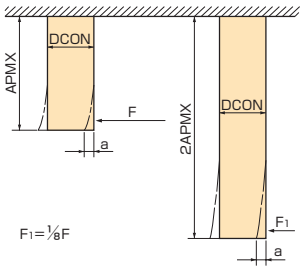


## ■底刃の形状

エンドミル底刃形状には、代表的なものにスクエアエンド、ボールエンド、ラジアスエンドがあり、OSGでは各種在庫を取り揃えております。この他にもコーナ面取り、コーナラウンディング、ドリルノーズなど、用途に合わせて対応しております。

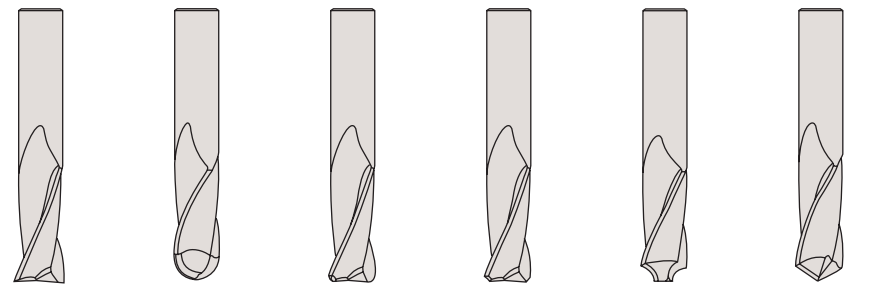


## ■TERMINOLOGY



## ■NUMBER OF FLUTES(ZEFP)

The number of flutes should be determined by the work material, dimensions of the work piece and milling conditions. In general, an end mill with a small number of flutes and large chip room is used for roughing, and an end mill with a large number of flutes is used for finishing.



## ■LENGTH OF CUT(APMX)

The shorter the end mill, the smaller the deflection and the stronger the rigidity. Because rigidity varies in proportion to length of cut by a factor to the power of 3 (for example, when the length of cut doubles, the rigidity decreases to 1/8), it is necessary to keep the length of cut as short as possible.

## ■END PROFILE

Stocked end profiles are typically square end, ball end and radius end. Corner radius, corner chamfer, corner rounding and drill nose end profiles can be supplied via special order.

2. When reducing cutting depth by half, the feeds can be increased approximately 2 times the above figures.
3. For side milling with 4-fluted end mills, the feed can be increased by 20～30%.
4. For heavy milling, use cutting fluids with high smoke retardant.
5. Use a rigid milling chuck with high holding power.

※ For roughing operations with V-XPM-NHS, the feed can be increased by 30～50%.

1. 機械、ホルダは剛性のある精度の高いものをご使用下さい。
2. 切削油剤は、被削材に適したものを選定して下さい。
3. 加工形状、切込深さ、機械剛性、ワーク保持等使用状況により、異常な切削音、振動、びびりが発生する場合、回転速度、送り速度、切込深さを調整下さい。
4. この切削条件表は、エンドミルの突出し量が、刃径×３倍以下を基準としたものです。突出し量が大きな場合は、回転速度、送り速度、切込深さを調整下さい。
5. 仕上げ加工で使用される場合（上表の条件で被削面の送りマークが気になる場合）は、上表の送り速度50%～60%に下げてご使用下さい。

＜エンドミル選定の目安＞
コーナ部の曲率が小さな負荷の掛かる加工には６枚刃を、曲率の大きな負荷の掛からない加工には10枚刃をご使用下さい。

1. Use a rigid and precise machine and holder.
2. Use suitable cutting fluids.
3. If abnormal cutting sounds, vibration or chattering occur depending on the machining shape, cutting amount, rigidity of the machine or work holding condition, etc., please adjust the speed, feed and the depth of cut.
4. These milling conditions are for an end mill where the tool extension length is 3 times the diameter of the end mill. When length of the tool extention from the machine is long, reduce the speed and feed and milling depth.
5. When it is used for finishing operation and feed mark on surface finish is a problem, please reduce the feed rate on the above chart by 50 ～60% .

<Guideline Line for End-mill Selection>
Please choose 6-flute type if it is used in internal corner milling with small radius that gives high load to an end mill. Otherwise, please select 10-flute type.

注) VP-LS-ZDSをご使用の場合は、上表の回転速度、送り速度を60%～80%として下さい。
When using VP-LS-ZDS, please decrease the RPM and feed rate to 60 - 80% of the figures in the above table.

1．上表は、ドリルによる下穴加工があることを前提としたものです。下穴径は、使用工具の外径50%以上を推奨します。
2．上表は、穴深さが1D以下の場合のものです。
3．下穴無しの加工の場合は、送り速度を上表の40～70%を目安として下さい。
4．機械、ホルダは剛性のある精度の高いものをご使用下さい。
5．加工物の形状や保持方法の状況によって切削条件を調整して下さい。
6．切削油剤は被削材に適したものをご使用いただき、十分に注油下さい。
7．加工穴の拡大が問題となるときは、回転速度、送り量を上表の値より下げて下さい。
8．切りくずを分断する必要があるときは必ずステップ送りを実施して下さい。
9．横形マシニングセンタで加工される場合は、特に切りくずの排出に注意下さい。
10.マグネシウム合金切削において、切削油剤を使用する場合は、切削油剤メーカの推奨するものを必ずご使用下さい。また、切くずの処理・管理に注意下さい。発火の恐れがあります。
11.斜面のドリリング前加工には、超硬ZDSシリーズを推奨します。選定の目安を参考にして下さい。

1. The chart above is based on the assumption that pilot holes are processed. For the diameter of the pilot hole, a value of over 50% of the selected tool's outer diameter is recommended.
2. These machining conditions apply to hole depths of 1D or less. (D=outer diameter)
3. For machining without pilot holes, set the feed rate to between 40 and 70% of the values indicated in the table above.
4. Use a rigid and precise machine and holder.
5. Adjust the rotational speed and the feed rate in accordance with conditions such as the machining shape, machine rigidity, or work holding.
6. Please use a suitable coolant for the work material and apply sufficiently.
7. If the problem of hole oversizing occurs, reduce the spindle RPM and feed amount lower than the amounts shown above.
8. We recommend step feeding when you require better chip breakage.
9. Pay particular attention to chip evacuation when using a horizonal machining center.
10. When machining magnesium alloy materials, please use the coolant oil recommended by the coolant oil manufacturer. Please also properly dispose the cutting chips to prevent fire hazards.
11. The ZDS Carbide Series is highly recommended for machining inclined surfaces. For more information, please refer to the application guide.

1. 機械、ホルダは剛性の高いものをご使用下さい。
2. 切削油剤は被削材に応じてエアブローまたは発煙性の少ない切削油剤をご使用下さい。
3. 給油の際は充分切りくずが排出できるよう考慮して下さい。

※ ロング刃は、ae＝0.1D、ap＝3Dを基準にし、回転速度・送り速度ともに上表の70～80%でご使用下さい。

1. Use a rigid and precise machine and holder.
2. Use an air blow or a suitable cutting fluid with high smoke retardant properties.
3. Consider the way of coolant supply to help smooth chip ejection.

※ For long flute end mills, use the following cutting conditions:Milling Depth＝0.1D (D＝mill diameter), Milling Width＝3D, Speed and Feed＝70～80% of the above settings.

## ★PSE 刃太タイプ
**Reduced Shank Type**

・刃太タイプは、シャンク径よりも工具外径の方が大きいため、金型部品などの深い立ち壁加工やポケット加工に最適です

・The outer diameter of the reduced shank type is larger than the shank diameter, making it highly effective in the processing of die and mold applications that require vertical wall milling or pocketing.

## ★PHC刃太タイプ
**Reduced Shank Type**

例 Example

・刃太タイプは、シャンク径よりも工具外径の方が大きいため、金型部品などの深い立ち壁加工やポケット加工に最適です

・The outer diameter of the reduced shank type is larger than the shank diameter, making it highly effective in the processing of die and mold applications that require vertical wall milling or pocketing.

## ★PXVC刃太タイプ
**Reduced Shank Type**

・刃太タイプは、シャンク径よりも工具外径の方が大きいため、金型部品などの深い立ち壁加工やポケット加工に最適です

・The outer diameter of the reduced shank type is larger than the shank diameter, making it highly effective in the processing of die and mold applications that require vertical wall milling or pocketing.

例 Example

シャンク側端面のR形状で、ステップ加工時の筋発生を防止します

The R shape on the shank side edge prevents streaks during milling.

★ 刃太タイプ
Reduced Shank Type

## ★ PXAL 刃太タイプ
**Reduced Shank Type**

・刃太タイプは、シャンク径よりも工具外径の方が大きいため、金型部品などの深い立ち壁加工やポケット加工に最適です

・The outer diameter of the reduced shank type is larger than the shank diameter, making it highly effective in the processing of die and mold applications that require vertical wall milling or pocketing.

例 Example

シャンク側端面のR形状で、ステップ加工時の筋発生を防止します

The R shape on the shank side edge prevents streaks during milling.

## ★PSE 刃太タイプ
**Reduced Shank Type**

・刃太タイプは、シャンク径よりも工具外径の方が大きいため、金型部品などの深い立ち壁加工やポケット加工に最適です

・The outer diameter of the reduced shank type is larger than the shank diameter, making it highly effective in the processing of die and mold applications that require vertical wall milling or pocketing.

## ★ PMD刃太タイプ
**Reduced Shank Type**

・刃太タイプは、シャンク径よりも工具外径の方が大きいため、金型部品などの深い立ち壁加工やポケット加工に最適です

・The outer diameter of the reduced shank type is larger than the shank diameter, making it highly effective in the processing of die and mold applications that require vertical wall milling or pocketing.

1. 機械、ホルダは剛性のある精度の高いものをご使用下さい。
2. 切込深さ、機械剛性等使用状況により、回転速度、送り速度を調整下さい。
3. 突出し量が長くなる場合は、びびりが発生しやすくなりますので、回転速度、送り速度、切込深さを調整下さい。
4. 切削条件は、ホルダ端面からのシャンクホルダ(PXMZ)の突出し長さにヘッド全長(LF)を加えた突出し長さを配慮した選定をして下さい。

1. Use a rigid and precise machine and holder.
2. Please adjust the speed and feed when the depth of cut is large or when machines with low rigidity are used.
3. Please adjust the cutting condition when the overhang length is longer.
4. Please consider the overhang length as the total length of replaceable head and overhang length of shank holder.

1. 機械、ホルダは剛性のある精度の高いものをご使用下さい。
2. 切込深さ、機械剛性等使用状況により、回転速度、送り速度を調整下さい。樹脂加工では、強固なワーク形状、固定方法の場合は送り速度が上げられます。
3. 突出し量が長くなる場合は、びびりが発生しやすくなりますので、回転速度、送り速度、切込深さを調整下さい。
4. 切削条件は、ホルダ端面からのシャンクホルダ（PXMZ）の突出し長さにヘッド全長（LF）を加えた突出し長さを配慮した選定をして下さい。
5. 銅・銅合金切削時は、上表の回転速度20～40%、送り速度50～80%、切込み深さ（ap）50～80%程度に下げてご使用下さい。
6. マグネシウム合金切削時は、アルミニウム合金展伸材と同条件でご使用下さい。切削油剤を使用する場合は切削油剤メーカの推奨するものを必ずご使用下さい。また、切りくずの処理・管理にご注意下さい。発火の恐れがあります。
7. 樹脂を加工する際、切りくずの噛み込み、巻き付きを防止するため、切りくずを除去して下さい。
8. 樹脂をより高品位に加工する場合は水溶性切削油剤の使用を推奨します（ナイロン系とベークライトを除く）。

1. Use a rigid and precise machine and holder.
2. Please adjust the speed and feed when the depth of cut is large or when machines with low rigidity are used. In resin processing, the feed rate can be increased if the shape of the workpiece and method of fixation are rigid.
3. Please adjust the cutting condition when the overhang length is longer.
4. Please consider the overhang length as the total length of replaceable head and overhang length of shank holder.
5. When milling copper and copper alloys, lower the rotational speed by 20 to 40%, feed rate by 50 to 80%, and cutting depth by ap 50 to 80% in accordance with the table above.
6. Please always use the appropriate cutting fluid recommended by the cutting fluid manufacturer in the machining of magnesium alloys. Be cautious with the cutting chips as they are highly flammable and may pose a serious fire risk if not properly handled.
7. When processing resin, please remove cutting chips to prevent them from getting caught or entangled.
8. For higher quality processing of resin, the use of a water-soluble cutting fluid is recommended (excluding nylon and Bakelite).

1. 切込深さ、機械剛性等使用状況により、回転速度、送り速度を調整下さい。 樹脂加工では、強固なワーク形状、固定方法の場合は送り速度が上げられます。
2. 銅・銅合金切削時は、上表の回転速度20 ～40%、送り速度50 ～80%、切込み深さ（ap）50 ～80%程度に下げてご使用下さい。
3. マグネシウム合金切削時は、アルミニウム合金展伸材と同条件でご使用下さい。切削油剤を使用する場合は切削油剤メーカの推奨するものを必ずご使用下さい。また、切りくずの処理・管理にご注意下さい。発火の恐れがあります。
4. 樹脂を加工する際、切りくずの噛み込み、巻き付きを防止するため、切りくずを除去して下さい。
5. 樹脂をより高品位に加工する場合は水溶性切削油剤の使用を推奨します（ナイロン系とベークライトを除く）。

1. Please adjust speed and feed when the depth of cut is large or machines with low rigidity are used. In resin processing, the feed rate can be increased if the shape of the workpiece and method of fixation are rigid.
2. When milling copper and copper alloys, lower the rotational speed by 20 to 40%, feed rate by 50 to 80%, and cutting depth by ap 50 to 80% in accordance with the table above.
3. Please always use the appropriate cutting fluid recommended by the cutting fluid manufacturer in the machining of magnesium alloys. Be cautious with the cutting chips as they are highly flammable and may pose a serious fire risk if not properly handled.
4. When processing resin, please remove cutting chips to prevent them from getting caught or entangled.
5. For higher quality processing of resin, the use of a water-soluble cutting fluid is recommended (excluding nylon and Bakelite).

・上記条件表はショートシャンクタイプにおける推奨値となります。
ロングシャンクタイプは、切削速度を上記条件表の80%でご使用下さい。
1. この切削条件基準表は、水溶性切削油剤を使用する場合のものです。
2. この切削条件基準表は、実切削速度における一般的な値を示したものです。加工環境に合わせて適宜調整して下さい。
3. インサートの装着に際しては、傷や汚れを取り除いた状態でしっかりと取り付けて下さい。
4. 被削材の保持はしっかりと行い、変形、たわみ、振動が起こらない状態にして下さい。

・Above recommended speed is for short shank type.
For long shank type, use the following cutting condition: cutting speed = 80% of the above settings.
1. The indicated speeds and feeds are for milling with water-soluble coolant.
2. The above cutting conditions are to be used as general guidelines. Adjustments may be necessary depending on actual cutting condition.
3. Inserts should be attached to the holder tightly in a very neat condition.
4. Fasten the work material to reduce the possibility of work deformation, deflection of machined surface, or vibration.

### ■センタリング加工深さの目安(H) Standard centering depth (H)

**SIG=90°の場合** When SIG=90°
Hmin=0.25
DCN =φ2.5(最小加工径)
(Minimum machined hole diameter)

$$H=\frac{C-DCN}{2}+Hmin$$
$$=\frac{C}{2}-1$$

**SIG=120°の場合** When SIG=120°
Hmin=0.1
DCN =φ2.4(最小加工径)
(Minimum machined hole diameter)

$$H=\frac{C-DCN}{3.46}+Hmin$$
$$=\frac{C}{3.46}-0.594$$

H:センタリング加工深さ C:皿穴径 H: Centering depth C: Countersink diameter

例) SIG=90° C=φ10(皿穴径)の場合 Example: When SIG=90°C=φ10 (Countersink diameter)
Hの値は5mmではなく、4mmになります。 The value of H will be 4 mm instead of 5 mm.

# インサート基準対応カッター一覧 CUTTER BODY SELECTION GUIDE FOR INSERT SIZE

コーナR=R2以上のインサートを使用する場合、カッタボディのコーナ部を修正する必要があります。
ボディ側のコーナR=インサートのR−1
(例:インサートR3の場合ボディにはR2のR)
When using an insert with a corner radius of R2 or greater, the corner of the cutter body must be corrected. The body corner radius should equal insert radius minus 1 (example: if insert radius is R3, body radius should be R2).

コーナR=R2以上のインサートを使用する場合、カッタボディのコーナ部を修正する必要があります。
ボディ側のコーナR=インサートのR－1
(例:インサートR3の場合ボディにはR2のR)

When using an insert with a corner radius of R2 or greater, the corner of the cutter body must be corrected. The body corner radius should equal insert radius minus 1 (example: if insert radius is R3, body radius should be R2).

**1**

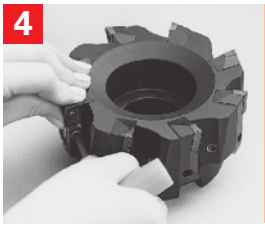
カッタ本体の付着物をエアで除去します。

First, remove debris from the cutter body using an air jet.

**2**

図の様に、調整ねじをカッタ本体に0.3～0.5ｍｍ突出して取り付けます。

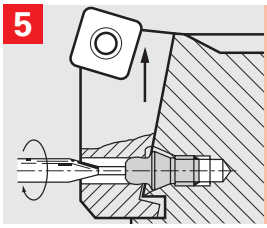
As shown, insert the adjustment screw so that it protrudes 0.3-0.5mm from the cutter body.



**3**

取り付けるカートリッジの付着物をエアで除去します。

Clean the cartridge using an air jet.



**4**

カートリッジをカッタ本体の基準面に押さえつけてカートリッジ用クランプねじで締込みます。

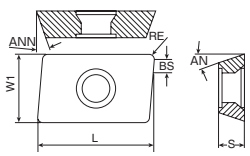
Hold the cartridge in place against the cutter body and tighten the adjustment screw.

**5**

刃先の調整は、ドライバで調整ねじを右回転させると図の矢印の方向に上がります。調整範囲は0.2 mmまで可能です。

Using a screwdriver, turn the adjustment screw clockwise to adjust the position of the cartridge. The cartridge will move in the direction indicated in the diagram. Adjustment is possible the range of 0.2mm

**6**



調整台にて刃先調整を行います。刃先は1μｍ内に調整できます。

Finally, use a micron adjustment platform to fine-tune the position to within 1 micron.

## コーナRインサート使用上の注意点!! Proper use of corner radius inserts!

### Rインサート使用時のボディ修正について
### Tips for modifying the cutter body when using radius inserts.

●フロントピース交換形についてはコーナRがR3以下を適用下さい。
Inserts with a radius of less than 3 should be used with the front piece type.

●コーナRがR2以上のインサートを使用する場合、カッタボディまたはカートリッジのコーナ部を修正する場合があります。
When inserts over R2 are used, the corner of the insert pockets on both cutter body and cartridge must modified to an appropriate radius for the clamping inserts.

目安：インサートのR－1＝ボディのR
Standard:R-1 for the insert = radius on cutter body

＊修正が必要な場合は受注品対応となりますので、御相談下さい。
Please contact our OSG staff or an OSG agent for details of our special modification service.

## コーナRインサート使用上の注意点!! Proper use of corner radius inserts!

**Rインサート使用時のボディ修正について**
**Tips for modifying the cutter body when using radius inserts.**

●コーナRがR2以上のインサートを使用する場合、カッタボディまたはカートリッジのコーナ部を修正する場合があります。
When inserts over R2 are used, the corner of the insert pockets on both cutter body and cartridge must modified to an appropriate radius for the clamping inserts.

目安：インサートのR－1＝ボディのR
Standard:R-1 for the insert = radius on cutter body

＊修正が必要な場合は受注品対応となりますので、御相談下さい。
Please contact our OSG staff or an OSG agent for details of our special modification service.

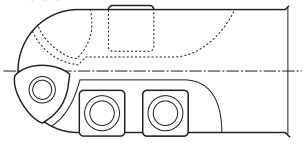
# F2339 & F2039

OSG-WALTERのボールエンドミルには、F2339とF2039があります。F2039は、千鳥刃となっている為、2溝で1枚刃となり、2枚刃タイプほど送りが上がらない弱点がありますが、切削抵抗が小さくびびりにくい点、インサートは3コーナ使え経済的な点などのメリットもあり、用途に応じて使い分けるとより効率の良い加工が可能です。



There are two types of ball nose cutters, the F2339 and F2039. As the F2039 has staggered teeth, two flutes make a complete tooth. The advantages of this are:1) low cutting force; and 2) economical inserts. However, a lower feed rate is required. Using the proper settings according to the situation will make production more efficient.

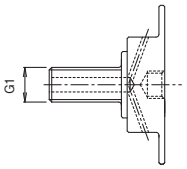
## ディスクカッタ PROの刃先高さ調整方法

**Setting Instructions for the axial concentricity of Disc Cutter PRO**

①インサート
Indexable insert
②クランプねじ
Clamping screw for insert
③調整ねじ
Adjusting screw
④ダイヤルゲージ
Dial gauge
⑤固定ねじ
Set screw

### 刃先高さ調整の手順 Setting of axial concentricity

手順1　固定ねじ⑤を緩めます。
手順2　インサート①をインサート座にクランプねじ②で固定します。
手順3　調整ねじ③のテーパ首部とインサートが接触しているか確認します。接触していない場合は、調整ねじ③を左回り（反時計回り）に締め込み、インサート①と接触させます。
手順4　この状態で刃先高さを測定し、最も高い刃を確認します。この最も高い刃に高さを合わせるように調整を行います。
手順5　刃先高さの低い刃の調整ねじ③を左回りに締め込み、刃先高さを最も高い刃の位置まで上げます。
手順6　固定ねじ⑤を締め込みます。
注意①　刃先高さは上げる方向にしか調整出来ません。調整可能な範囲は0.15～0.2mmです。調整範囲の上限に近いところでは、刃先高さが上がりにくくなります。この場合は、一旦インサート①を取り外し、調整ねじ③を緩めた状態から再度調整を行って下さい。
②　ダイヤル端子をインサートへ接触させたり離したりする際には、大きな衝撃を与えないよう注意して下さい。



1　Loosen set screw ⑤.
2　Place indexable insert ① on the insert seat and tighten it with clamping screw ②.
3　Check that the tapered neck of adjusting screw ③ is in contact with the insert. If it is not in contact, tighten adjusting screw ③ counterclockwise until it contacts insert ①.
4　In this state, measure the edge height in order to check for the highest cutting edge. Then, adjust the height to the highest cutting edge that was measured at this time.
5　Tighten counterclockwise adjusting screw ③ for the short cutting edge until it reaches the height of the highest cutting edge.
6　Tighten set screw ⑤.
Note① An edge height can be adjusted only in the upward direction. The adjustable range is between 0.15mm and 0.20mm. The edge height may not increase easily near the upper limit of the adjustment range. In this case, first remove insert ① and loosen adjusting screw ③. Then, readjust the height.
Note② Do not to apply a large shock when placing the dial terminal in contactwith the tip.

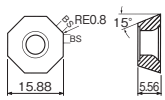
## F2010 P5E43R 切削条件 Cutting Conditions P1128-157

高剛性8角形インサートを使用し、高い経済性と切削性能を両立。切込みが4mm以下であれば8コーナ使用でき経済的です。インサートは1サイズ厚い5.56mmとなっており、135°の鈍角のコーナと併せて非常に高い刃先剛性を実現しています。



The rigid, octagon inserts provide cost-efficient, high milling performance.
If the milling depth is less than 4mm, the insert can use eight corners. The thickness of insert-5.56mm and the obtuse angle corner 1350, provide superior rigidity on the milling edge.

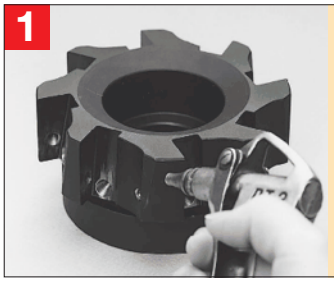
# F2010Mマイクロフェースの取扱い方法 ADJUSTING THE F2010M MICRO-FACE CUTTER

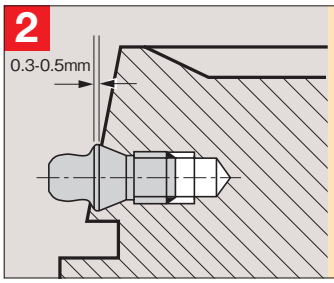


## ミクロン台の刃先調整が可能

It is possible to adjust the position of the cutting faces using a micron adjustment platform.

ミーリングカッタによるフライス加工において、各切れ刃間の精度差は①仕上げ面粗さ　②インサート寿命に大きな影響を与えます。
F2010Mマイクロフェースタイプは、ボディ本体に取り付けられる調整ねじにより、刃先高さをミクロン台に調整することができ、インサート寿命の延長をもたらすとともに、特に仕上げ切削において、超高送り切削を可能としました。

When using multiple tooth milling cutters, both the surface quality obtained after milling and the insert life depend on fine adjustment of the insert position.
Cartridges are attached to the F2010M Micro-face cutter using a special clamping screw. By using a micron adjustment platform super-fine adjustment of the tooth height is possible. Tool life can be extended and high feed-rate processing can be performed while still maintaining an excellent surface finish.



**1**

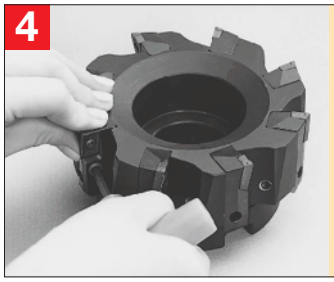
カッタ本体の付着物をエアで除去します。

First, remove debris from the cutter body using an air jet.

**2**

図の様に、調整ねじをカッタ本体に0.3～0.5mm突出して取り付けます。

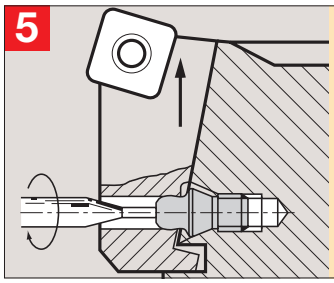
As shown, insert the adjustment screw so that it protrudes 0.3-0.5mm from the cutter body.



**3**

取り付けるカートリッジの付着物をエアで除去します。

Clean the cartridge using an air jet.



**4**

カートリッジをカッタ本体の基準面に押さえつけてカートリッジ用クランプねじで締込みます。

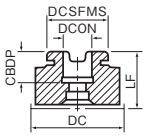
Hold the cartridge in place against the cutter body and tighten the adjustment screw.

**5**

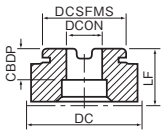
刃先の調整は、ドライバで調整ねじを右回転させると図の矢印の方向に上がります。調整範囲は0.2mmまで可能です。

Using a screwdriver, turn the adjustment screw clockwise to adjust the position of the cartridge. The cartridge will move in the direction indicated in the diagram. Adjustment is possible the range of 0.2mm.

**6**



調整台にて刃先調整を行います。刃先は1μm内に調整できます。



Finally, use a micron adjustment platform to fine-tune the position to within 1 micron.

1. 実際の加工における切削条件は上表を参考に状況に応じて設定下さい。
2. 最大の切込み量は、機械の出力、剛性、被削材、その他の加工環境により変化します。これらの項目を十分配慮の上条件設定を行って下さい。
3. 切削油剤を使用する場合は低めの切削条件を設定下さい。
4. 機械、ワーク、ワーククランプの剛性が低い場合は、低めの条件設定を行い、加工の状況に応じて条件を変更下さい。

1. Refer to the table above to set the cutting conditions in accordance with the actual situation.
2. The maximum milling amount varies in accordance with the machine's power output, rigidity, work material, and other work conditions. Before setting the work conditions, please take these details fully into consideration.
3. Set low cutting conditions when using a cutting fluid.
4. Select low conditions when the rigidity of the machine, work, or the work clamp is low. Adjust the conditions to suit the machining conditions.

Note)
● When using a tool with a long extension, reduce the milling depth, feed and speed, and increase gradually in order to find the optimal working conditions.
● High feed rate machining creates thick chips. Therefore, use an air blower to immediately remove the chips from the milling area.

この数値は基準値です。加工の状況を確認の上、切削条件選定願います。
These numbers represent reference values. Select the proper cutting conditions after checking the actual machining conditions.

※加工プログラム作成上の注意点
・高硬度材を加工する際はフル溝加工の箇所が極力少なくなるようなパス（トロコイド切削など）を作成下さい。
・急激な切削負荷の変化が発生するポケットのコーナ部などではびびりが発生しやすい為、送りを落としたり、Rをつけて曲がるなどしてびびりを抑制するようにして下さい。
・Z軸方向へ切込む時はヘリカル加工で行うようにして下さい。
※加工上の注意
・切りくずはエアなどで切削箇所から除去することで、切りくずのかみ込みによる工具の損傷を防ぐことが出来ます。
・突出しを長くして使用する時は、低めの切削条件より徐々に上げるようにして適正な加工条件を見つけるようにして下さい。
※工具取り扱い上の注意点
・インサートのクランプねじは必要以上に締め込まないようして下さい。

**Notes on creating machining programs**
To work on high hardness materials, create passes(such as making trochoid cuts) with minimal full-groove cutting areas.
The corners of pockets that cause sudden changes in the cutting load are susceptible to chattering. For this reason, minimize chattering by reducing the feed rate or providing curves along those corners.
Make helical cuts when plunging in the Z direction.

**Notes on machining**
By air blowing the cutting chips from the cutting areas, the tool can be protected from damage associated with the jamming of the chips.
When using the tool with a long extension, start with minimal cutting conditions, and work gradually up in order to find the optimal working conditions.

**Notes on handling tools**
Do not overtighten the screw for clamping the insert.

## ●コパスリップ／ COPA SLIP

締付けねじ用の特殊潤滑油コパスリップは、極端な温度変化に対しても優れた耐久性を持っています。不溶解性ベントン油をベースに超微粒子の銅・鉛を精巧に混ぜ合わせ、ねじの表面保護と焼付き防止作用、酸化や腐食の保護も行います。コパスリップの使用によって、ねじを簡単迅速に取り外すことができます。

COPA SLIP special clamping screw lubrication has excellent heat-resistance and durabilty. COPA SLIP is made with a non-soluble base of Beston oil containing fine particles of copper and lead. This mixture safeguards the surface of the screw from corrosion, wear and extreme heat. COPA SLIP enables easy clamping screw insertion and removal.

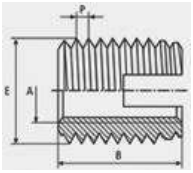
# 商品シリーズ エンザート ENSAT

Kerb Konus

ISO/TS 16949:2002認定工場
ケー・ケー・ヴィ・コーポレーション株式会社

■エンザートは直タップではめねじ破壊が起こり易い樹脂やアルミ等に使用出来る作業性の良いインサートナットです。
■割溝又は三つ穴形状の切刃を持ち、自身の刃で相手材を切るので前タップが必要ありません。
■エンザートでめねじ補強すれば、部品のアルミ化や樹脂化が可能になるので、軽量化に役立ちます。
■エンザートは内ねじに加わる力を一回り大きい外ねじで支えるため、直タップに比べて高い力に耐えることが出来ます。
■エンザートを使った補強は相手材固有のせん断強さ、又は使用するボルトの機械的強さが限界となります。

■Ensat is a lineup of highly workable insert nuts that can be used for resin and aluminum materials, etc. whose internal threads are easily damaged when direct tapping is employed.
■Equipped with cutting edges (slots or three holes), these insert nuts are designed to cut the mating material, eliminating the need for preliminary tapping.
■By reinforcing internal threads with Ensat, parts can be manufactured using aluminum and resin, helping reduce weight.
■Ensat is designed to bear the force applied to the internal thread with the external thread (that is larger than the internal thread), and offers higher bearing force than direct tapping.
■Reinforcement using Ensat is limited by the shear strength of the mating material or the mechanical strength of bolts used.



## ■302型 割溝タイプ 302 slot type

### ■特徴 Feature

• 快削性のあるアルミ合金や可塑性の高い樹脂などに使用できます。
• 切り刃である割り溝部分が長く、相手材によく食いつきます。
• 下穴径を小さめに設定したり硬い相手材に挿入すると、先端の割溝部がすぼんで加工不良が発生します。

· Applicable for free-cutting aluminum alloys and highly plastic resins, etc.
· The long slots (cutting edges) ensure smooth cutting of the mating material.
· When the borehole diameter is small or Ensat is inserted into hard mating materials, the slots at the tip may be bent inwards, resulting in machining defects.

## 各タイプの使い分け Application by type

エンザートは樹脂、アルミ、木材に使用出来ますが、下の例のように相手材質によりタイプを使い分ける必要があります。
割溝タイプは高強度材料に使用したり、下穴径を小さめに設定すると、加工不良を起こす場合があります。
小外径タイプ(303,347/348型)は、内径同サイズの標準タイプ(302,307/308型)に比べ、外径が小さいため各種強度が低下します。
スペースに制約がある場合を除き、標準型をお勧めします。

Ensat can be used for resin, aluminum, and wood. Different types must be used depending on the mating materials, as shown in the examples below.
In the case of a slot type, machining defects may occur if Ensat is used with high-strength materials or if the diameter of the borehole is small.
For the small outer diameter type (303, 347/348), the outer diameter is smaller than that of the standard type (302, 307/308), whose inner diameter is the same. Thus, the small outer diameter type is weaker than the standard type.
The standard type is recommended unless space is limited.

## ■307/308型 三つ穴タイプ 307/308 three-hole type

### ■特徴 Feature

- 割溝型と違いエンザートがすぼまることは無いので、硬軟どちらの相手材にも広く適しています。
- 基本的には樹脂やアルミに使用しますが、タップを併用すると鉄や熱処理アルミに使える可能性があります。

· The three-hole type is widely usable for both hard and soft mating materials because the shape is different from the slot type, whose slots at the tip may be bent inwards.
· In principle, the three-hole type is used for resin and aluminum. In combination with tapping, the three-hole type may be used for steel and heat-treated aluminum.

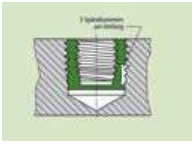
# 商品シリーズ エンザート ENSAT



## 337/338型 チップフリータイプ 337/338 insert,free type

### 特徴 Feature

- 三つ穴の切り刃が止まり穴になっているので、挿入時に出る切り粉を閉じ込めることができます。
- 挿入加工の食いつき時に僅かに切り粉が外に出ますが、大部分は止まり穴に収まるので切り粉の除去工程が不要です。
- 相手材が金属の場合、下穴径は最大下穴径でご使用下さい。

- The cutting edges of the three holes serve as blind holes, containing chips that are generated in the insertion process.
- In the insertion process, some chips are generated at the start of cutting. However, most of the chips are retained in the blind holes. This eliminates the need for removing chips.
- When the mating material is a metal, select the largest borehole diameter.

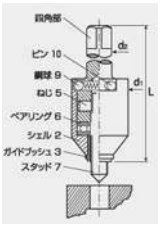
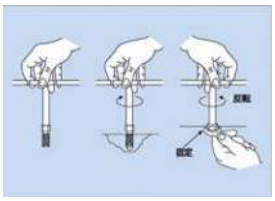
## 挿入工具 Insert tools



■反転位置を機械側で設定できるタッパー又はボール盤を使用して下さい。
■目測による反転では専用工具とワークの衝突を完全に防げないため、加工不良の原因となります。
■専用工具の先端スタッドやベアリングを保護するためにも反転位置は事前に設定して下さい。

■Use a tapping machine or drilling machine that enables users to set a reversal position.
■Reversal based on eye measurement cannot completely prevent interference between a custom tool and a workpiece, resulting in a machining defect.
■Set the reversal position in advance to protect studs at the tip and bearings of custom tools.



1. 割溝又は三つ穴を下にし、専用工具にエンザートを取り付けます。
2. 下に送っていくとワークにエンザートが喰い付きます。その後は回転だけで下穴をセルフ・タップします。
3. 事前に設定した加工深さで回転が反転すればピンの位置が右に移動し、専用工具だけがリリースされます。

1. Install Ensat to a custom tool, with the slots or three holes pointing downward.
2. Lower Ensat until it starts to cut the workpiece. The hole is self-tapped only by rotation.
3. When the rotation is reversed at the preset machining depth, the pin position moves to the right. Only the custom tool is released.

■ハンド専用の610工具だけでなく機械用の620,621工具も使用できます。
■Ensat works with 610 (hand-operated type) and also 620/621 (machine type) tools.

1. 割溝又は三つ穴を下にしてエンザートを最後まで工具先端に取り付けます。620,621 工具を使う場合は必ずピンの位置を意識的に向かって左側に来るようにして下さい。
2. エンザートの喰付き時（1 ～2ピッチ）にX、Y、の両方向から下穴に対して傾きがないかチェックして下さい。傾きがあれば工具を反転しないで立て直して下さい。エンザートが1/3 ～ 1/2以上入った後は立て直しは不可になります。
3. 所定の位置まで入ればハンド専用610工具は六角部をスパナで固定しハンドル側を左へ反転すれば工具だけフリーになります。620,621工具はシェルが共回りしないように反転してください。

1. Fully install Ensat to the tip of a tool, with the slots or three holes pointing downward. When using a 620/621 tool, make sure to set the pin to the left.
2. When the Ensat starts to cut (1–2 pitches), check from both X and Y directions that the tool is not tilted to the borehole. If the tool is tilted, align it without reversing the tool. The tool can no longer be aligned after Ensat is inserted by more than 1/3–1/2.
3. In the case of a 610 hand-operated tool, insert Ensat to a specified position, secure the hexagonal section using a spanner, and reverse the handle to the left to release the tool. In the case of a 620/621 tool, prevent simultaneous rotation of the shell at the time of reversal.

## ミニポーターサイクロン Mini-Porter-Cyclone

### 大量の粉塵・粉体の処理に！ あらゆる掃除機との組み合わせOK!

Suited to sucking up a large amount of powder and fine dust! Can be used in combination with any type of cleaner!

### 粉塵・粉体の処理にお困りの方へ For problems with powder and fine dust

粉塵や粉体を掃除機で回収する場合、フィルターの目詰まりの頻度が高く掃除機の"掃除"に手間がかかっているが……「ミニポーターサイクロン」は掃除機のパワーによってサイクロン内の空気を吸引して粉体を呼び込むと同時に、下降らせん気流(遠心力)を発生させ、粉体を自重と気流でサイクロン下部の容器に落とし込み回収する構造になっており、粉体等がフィルターを通過しないのが大きな特徴です。例えば小麦粉などの回収は、ほぼ100%可能です。
When a conventional cleaner is used to suck up powder and fine dust, the filter gets clogged frequently, and it takes time to clean the cleaner.
The Mini-Porter-Cyclone takes advantage of the power of a cleaner to suck air in the cyclone and remove powder. A downward spiral air current (centrifugal force) is generated to trap and recover powder in a container at the bottom of the cyclone by means of a dead weight and an air current. Powder etc. does not go through the filter. For example, almost 100% of flour can be recovered.

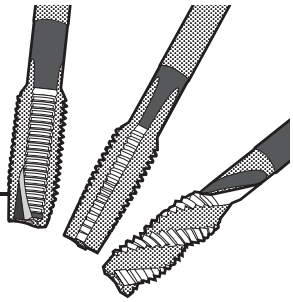
# 商品シリーズ タッピングオイル TAPPING OIL

## タッピングマイティペースト TMP TAPPING MIGHTY PASTE

**タッピングマイティペーストTMPは、非常に使い勝手の良いペースト状タップ作業用切削剤です。常温でペースト状のため、取り扱いが容易で使用量も少なくて済み、横型機械でのタッピングにも最適です。タップの切削熱で液状となり、加工部に浸透するため、切りくずの排出性も良好で作業環境を汚すこともありません。**

Tapping Might Paste (TMP) is very handy tapping paste. Because it is paste type oil at normal temperature, it applies to tapping operation on horizontal machining center. As it changes to liquid with the cutting heat of tapping operation, the oil can be easily penetrated into machine parts, evacuate chips smoothly, and keep working environment clean.



**特長** Features & Benefits

- ＊合金鋼、ステンレス鋼、銅、アルミニウムとあらゆる材質に適応できます。被削材質によって油種を変える必要はありません。
- ＊環境問題に配慮した、非塩素タイプです。
- ＊小径から大径にいたる広範囲に適用可能で、特に低速加工において効果を発揮します。

- ＊TMP applies to a wide range of work materials such as alloy steels, stainless steels, copper, aluminum alloys.
- ＊It is non-chlorine oil.
- ＊It applies to a wide range of tool size, and it especially achieves high performance in low speed machining.

# 法令一部改正によるコバルトの特定化学物質指定について

About the designation of cobalt as a specified chemical substance by the revision of the law

2014年10月30日

October 30, 2014

**お客様各位**

下記に記載の通り、コバルトが特定化学物質に指定されました。工具を通常使用する場合は健康障害を引き起こすことはありませんが、お客様に安心して弊社の製品をご使用いただく為にも、弊社製品のコバルト含有の有無を総合カタログへ記載することにいたしました。ご確認いただきますようお願い申し上げます。

**1. 法改正内容について**

労働安全衛生法施行令等一部改正により特定化学物質の第2類物質として「コバルト及びその無機化合物」が新たに追加指定され、2012年9月20日公布、2013年1月1日施行されております。

法改正に伴い、特定化学物質による健康障害防止措置として下記対策を講じる必要があります。

- 製品（粉末・合金・工具）への表示　※
- 発散抑制措置（コバルト濃度として0.02mg/㎥以下）
- 漏洩のための措置
- 作業主任者の選任
- 作業環境測定（6ヶ月毎）
- 健康診断（6ヶ月毎）、記録の30年保管
- 保護具装備、作業記録30年保管、休憩室設置、洗浄設備設置、取扱注意表示

※「製品への表示」のうち「工具への表示」につきましては、以下の通りです。
当業界の工具は、労働者による取扱いの過程において工具等の摩耗により作業者が健康障害を生じるコバルト粉じん等の飛散はないため表示対象外製品であると判断されました。従いまして表示に関しましても今まで通り変更ございません。

**2. 法改正に伴う対応について**

（1）工具をご使用いただくお客様

工具を通常ご使用いただく場合は、工具等の摩耗により作業者が健康障害を引き起こすコバルト粉じん等の発散は生じないことから、特定化学物質による健康障害防止措置を実施する対象となりません。今までどおりご使用いただきますよう、お願い申し上げます。

（2）コバルトを含む工具を購入され、それを研削などにより追加工をされるお客様

コバルトを含む工具の追加工および再研削工程などでは、上記1項の対策を講じる必要があると思われます。なお、詳細は所轄の労働基準監督署または法令等でご確認ください。

**Dear Customers**

As described below, cobalt has been listed as specified chemical substances. Although it does not cause health problems in regular use of tools, however, for our customers to be able to use our products with confidence, we put a notice on our catalog about which tool contains cobalt. We ask you to refer it for your information.

**1. The amendments of the law**

"Cobalt and its inorganic compounds" are newly added as second type of specific chemical substances by the partial revision of Ordinance for Enforcement of the Act on Occupational Safety and Health, issued on September 20, 2012, and enforced from January 1, 2013.
According to the amendments to the Act, we must take following actions to prevent health problems caused by specific chemical substances.

- Marking on the tools (Powder, Alloys, Tools) ※
- Divergence control measures
  (Less than 0.02mg / $m^3$ as cobalt concentration)
- Measures for leakage
- Appointment of Operations Chief
- Measurement and working environment
  (every 6 months)
- Keeping health diagnosis records for 30 years
  (every 6 months)
- Wearing protective equipment, Keep work records for 30 years, Set up a break room, Installation of cleaning equipment, handling notices

※Details of "Making on Tools" found in "Making on Product" are as below:
Scattering of cobalt dust which causes health disorders are not recognized during the machining process using tools of our industry. Therefore, it is judged that the marks indicating cobalt is unnecessary and no changes are made with the marks on products.

**2. The correspondence with the revision of the law**

(1) Customers who use the tool
Ordinal usage of tools does not cause the scattering of cobalt dust which causes the health disorders. Therefore, it is not subject to take actions preventing the health impairment of workers. Please use our product as before.

(2) Customers who purchase the tool contain cobalt, and make any alterations to it such as by grinding
It is required for the processes as re-grinding and alteration to the tool contains cobalt to take measures above Section 1. Since there is a setting of the grace period, please check the laws of regulations of the competent or Labor Standards Inspection Office for more information.

# 安全にお使いいただくために
Observe These Precautions For Safe Use

## 加工前の注意　Prior to Operations:

●鋭利な切れ刃を素手で触るとけがの危険があります。切れ刃を素手で触らないで下さい。特にケースからの取り出し時や機械への操着時には、保護手袋等を使用して下さい。
●重量の重い工具を扱う時は、落下によるけがの危険があります。適切な運搬機具やチェーンブロック等を使用し、安全靴を着用して下さい。
●工具に傷､割れ等があると使用中に破損し飛び散ることがあります。使用前に傷、割れ等のないことを確認して下さい。
●使用前に工具および加工物の寸法を確認して下さい。
●回転方向を誤ると工具が破損、飛散しけがをする危険があります。使用前に回転方向を確認して下さい。
●工作機械保持具を含めた回転部のバランスが悪いと、振れ振動により工具が破損しけがをする危険があります。試運転を必ず実施し、バランスの確認をして下さい。
●工具の保持が不十分ですと破損、飛散を招きけがをする危険があります。ホルダ等は、工具および加工内容に見合ったものを使用して下さい。工具はホルダにしっかりと固定し、振れを抑えるようにして下さい。インデキサブル工具では、インサートや部品が確実にクランプされている事も確認して下さい。
●加工物の保持が不十分ですと、工具や加工物が破損し飛散する危険があります。加工物の保持は確実におこなって下さい。

● Touching sharp cutting edges with bare hands can cause injury. Never touch the cutting edges with bare hands. Wear protective gloves, especially when removing tools from the case and attaching them to the machine.
● When handling heavy tools, dropping poses danger. Use appro-priate transport equipment or chain block and wear safety shoes.
● Scratches or cracks in the tools can cause breakage and flying debris during operation. Ensure that there are no scratches or cracks prior to using the tools.
● Check if the tools and the work materials are correct prior to use.
● If the tool is rotating in the wrong direction, it can cause breakage or flying debris, leading to injury. Check the rotation direction prior to use.
● If the rotational balance is poor (including that for the retainer of the machine tools), the shaking vibration could cause breakage and lead to accidents. Ensure that you always carry out a test operation and check the balance.
● Insufficient retention of the tool can lead to breakage or flying debris, causing injuries. Ensure you use holders, etc. that match the tools and the nature of the processing operations. The tool should be firmly attached to the holder to prevent shaking. When using indexable tools ensure you check before-hand that indexable inserts and parts are securely clamped.
● Insufficient retention of the work materials can cause tools and work materials to break or cause flying debris. Ensure that the work materials are firmly secured.

## 加工する時の注意　During Operations:

●回転中の工具、加工物等に触るとけがをします。回転中の工具、加工物等には絶対に触らないで下さい。また、衣服にたるみがあると巻き込まれる危険があります。たるみのない衣服を着用して下さい。
●工具が加工中に衝撃的な負荷を受けると破損、飛散しけがをする危険があります。また、高温の切りくずが飛散し、けがや火傷をする危険があります。必ず安全カバーや保護めがね等の保護具を使用して下さい。
●工具を改造したり、本来の使用目的以外で使用すると、工具が破損、飛散しけがをする危険があります。工具は改造しないで下さい。本来の使用目的で使用して下さい。
●切削条件基準表の数値は、新しく作業を立ち上げる時の目安として下さい。加工物の形状や機械剛性に合わせて切削条件を調節する必要があります。
●加工中に異常な振動等が発生した場合は、直ちに加工を中止して下さい。そのまま続けると工具が破損、飛散しけがをする危険があります。異常の原因を取り除いてから加工を再開して下さい。
●摩耗が進んだり、痛んだ状態の工具を使用し続けると破損、飛散の原因となります。切れ味が悪くなったら工具を交換して下さい。
●用途に応じ切削油を選定して下さい。不水溶性切削油剤を使用する時は、加工時に発生する火花や破損による発熱で引火、火災の危険があります。防火対策を必ずおこなって下さい。

● Touching the tools or the work materials during rotation can cause injury. Never touch tools or work materials during rotation. As loose clothing can become caught in mechanisms, ensure that you wear work clothes that can not become caught.
● If the tool receives a shock load during processing, this can cause breakage or flying debris, leading to injury. As hot flying cutting chips cause injury or burns, ensure you use protective equipment including safety covers and eye protection.
● Modifying the tool or attempting to use it for purposes other than the original purpose can cause breakage or flying debris, leading to possible injury. Never attempt to modify the tool and never use it for any purpose other than the designated purpose.
● The numerical value listed in the table of recommended cutting conditions should be used as a general guide when starting new operations. It is necessary to adjust conditions according to the dimensions of work materials and the rigidity of the machine.
● If abnormal vibration, etc. occurs during processing, stop processing immediately. Attempting to continue processing can cause tool breakage or flying debris, leading to possible injury. Ensure that you eliminate the cause of the abnormality before resuming processing.
● Attempting to use tools with considerable wear can cause breakage or flying debris. Replace the tool when it no longer cuts well.
● Select a cutting oil appropriate to the particular usage. Using a non-water-soluble cutting oil could lead to fires due to sparks generated during processing or heat caused by breakage. Ensure that you take proper fire-prevention measures.

## 加工後の注意　After Use:

●加工直後の工具、加工物は、高温になっているため火傷をする危険があります。加工物を素手で触らないで下さい。
●加工物に生じたバリでけがをする危険があります。素手で触らないで下さい。
●加工後は必ず加工物の寸法を確認して下さい。
●工具を再研削すると粉塵が発生します。粉塵は健康を害する危険があるので、必ず防塵マスク、吸塵機等の粉塵対策をして下さい。

● Tools and work materials are very hot immediately after processing. Never touch them with your bare hands.
● The burrs generated during processing can cause injury. Never touch them with your bare hands.
● Ensure that you check the measurements of the work materials after processing.
● When the tool is reground, grinding dust is generated which is dangerous to your health. Ensure that you take proper safety measures such as wearing a dustproof mask or using a respirator.
